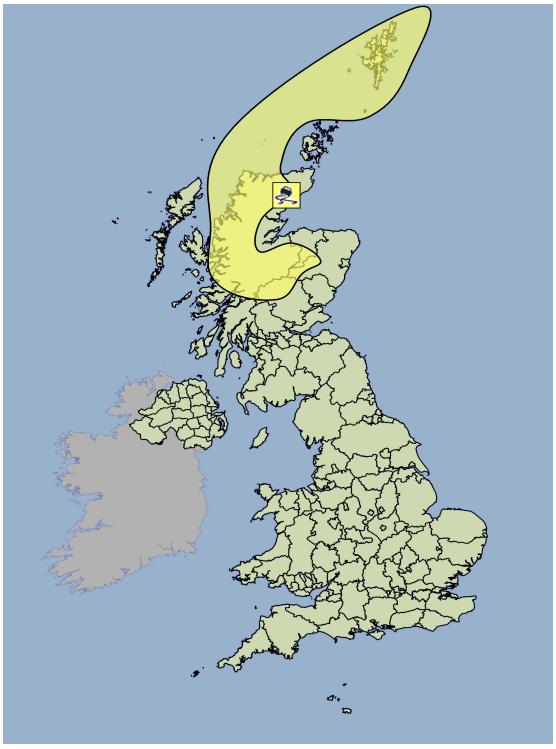
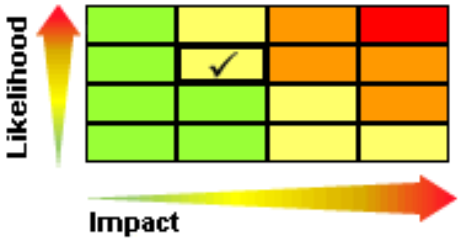
National Severe Weather Warning Service





Chief Forecasters Assessment
An east or southeasterly flow across the north of Scotland will introduce colder air of continental origin. As this happens falling temperatures will lead to icy stretches forming on any untreated surfaces, initially across Shetland then across the mainland on Monday evening. In addition outbreaks of rain will turn increasingly to snow giving a covering in places. Temperatures will probably rise above freezing in Shetland later in the night as a frontal trough moves in from the southeast.

The Met Office have issued a **Yellow Warning** of **Ice**

Valid from **16:00 on Mon, 27th Jan 2014** until **10:00 on Tue, 28th Jan 2014**

Ice is expected to form on untreated surfaces later on Monday and through the early part of Tuesday. In addition, snow showers are increasingly likely across Shetland on Monday and across the northern Scottish mainland on Monday night into early Tuesday, giving a cm or two in places. Note that significant amounts of further snow are expected across the Grampians.

The public should be aware of the risk of disruption to travel.

In addition there is a risk of ice accretion on exposed power lines in Shetland in the bitterly cold gale force southeasterly winds.
